

TAV Networks, Inc.

Technology Expertise. Business Experience.
Service Excellence.

We Develop For The Internet of Things.

TAV Networks has decades of combined experience providing technology solutions and innovative product design for the utility industry. We specialize in building smart networks using cutting edge sensor technology with comprehensive communications systems. We have experience with system implementation and IT integration.

Why choose TAV?

TAV Networks is more than your typical consulting firm. We provide real solutions to issues that arise during utility smart network infrastructure deployments. We are experienced with Smart Meters, line sensors, voltage sensors, data capture, and remote asset protection. We have a comprehensive product and service offering that will guide your project from conception to the completion of your network deployment and beyond.

We have hard earned, real life experience executing deployments with PG&E, Baltimore Gas & Electric, BC Hydro, and more. We are experts with the process, potential pitfalls, and system integration of these projects, and we are available to support yours too. We work in whatever capacity the project requires, be it remotely or on-site beside your project team.

We have already helped several major utilities throughout North America.

What can we do for you?

TAV Networks, Inc.

We Develop For The Internet of Things.

Utility Industry Experience: Network Engineering and Network Design Services

- We perform Network Health Analyses which take into account utilities' contractual requirements, such as: coverage, read rates, latency, hop counts, and more. We provide estimates of how many more network devices will be needed to optimize your network.
- We bridge the performance gap between equipment vendors and the Utility, by ensuring proper equipment performance in real-world situations and providing alternative communication solutions.

- We offer project management and process development consulting throughout all facets of a utility's network deployment and optimization lifecycle.
- We have desktop-designed and field tested solutions for gas, electric, and water meters in every type of terrain or areas of poor RF coverage: cities, mountains, forests, cellular dead zones, rural neighborhoods, underground vaults, commercial areas, and military bases.

- Our field engineers investigate and repair meters and network devices with utility and vendor provided optical port and wireless tools; when existing tools and processes aren't sufficient for the job, we have the expertise to create our own.
- We perform acceptance testing of AMI vendors' firmware, software, and hardware. We verify and certify new SW/FW versions, both with devices in the lab and devices already installed in the field.
